

**Amendments to the Claims:**

*This listing of claims will replace all prior versions and listings of claims in the application.*

**Listing of Claims:**

1. (Cancelled).

2. (Cancelled).

3. (Withdrawn) A vacuum heat insulator having plural core members coated with a gas barrier enveloping member, and evacuating and sealing the inside of the enveloping member, wherein said plural core members are disposed in lattice layout or zigzag layout at mutual specific intervals so as to form folding lines in two or more directions in the position between the adjacent core members, and heat seal parts of the enveloping member are disposed around the core members so that the plural core members may be located in independent spaces individually.

4. (Withdrawn) The vacuum heat insulator of claim 3, wherein the enveloping member is heated and fused by heating and pressing including the core member portions.

5. (Withdrawn) The vacuum heat insulator of claim 3, wherein all of the enveloping member positioned on the outer periphery and the enveloping member in the position between adjacent core members are heated and fused.

6. (Withdrawn) The vacuum heat insulator of claim 3, wherein there are non-seal parts not heating and fusing the enveloping member, between adjacent core members and on the outer periphery of the core members on both sides of the heat seal parts.

7. (Withdrawn) The vacuum heat insulator of claim 3, wherein holes are opened in the enveloping member so as to leave heat seal parts of specified width between adjacent core members.

8. (Previously presented) The vacuum heat insulator of claim 27, wherein through-holes are formed in the thickness direction of the core member, and

wherein said heat seal layers are heated and fused over said through-holes and along the shape of said through-holes.

9. (Previously Presented) The vacuum heat insulator of claim 8, wherein the shape of the through-holes is an arbitrary shape including triangular, quadrangular, polygonal, circular, elliptical, L-shape and combinations of shapes thereof.

10. (Previously presented) The vacuum heat insulator of claim 9, wherein holes are not formed in the first and second enveloping members in the area of said through-holes of the core members.

11. (Previously presented) The vacuum heat insulator of claim 27, wherein all parts having core members within the first and second enveloping members are heated and pressed.

12. (Previously presented) The vacuum heat insulator of claim 27, wherein the heat seal parts having cores within the first and second enveloping members are melted by heating and pressing, and are fused with the surface portion of the core member.

13. (Previously presented) The vacuum heat insulator of claim 27, wherein the first and second enveloping members are cut off so as to leave heat seal parts of a specified width along the core member.

14. (Previously presented) The vacuum heat insulator of claim 13, wherein the first and second enveloping members are cut off by melting down.

15. (Withdrawn) The vacuum heat insulator of claim 3, wherein the plural core members are covered with the enveloping member, together a the sheet member, in a state being fixed to one side or both sides of the sheet member.

16. (Withdrawn) The vacuum heat insulator of claim 15, wherein the sheet member is made of thermoplastic resin.

17. (Withdrawn) The vacuum heat insulator of claim 3, wherein the core member is triangular, hexagonal, or octagonal in shape.

18. (Previously presented) The vacuum heat insulator of claim 27, wherein the core member has an arbitrary shape including triangular, quadrangular, polygonal, circular, elliptical, L-shape and combinations of shapes thereof.

19. (Previously presented) The vacuum heat insulator of claim 4 or 27, wherein the thickness of the vacuum heat insulator is 0.5 mm or more to 5 mm or less.

20. (Withdrawn) A manufacturing method of vacuum heat insulator comprising the steps of disposing a flat core member between mutually facing heat seal layers of gas barrier enveloping member having heat seal layers, heating and pressing the portion including the core member present portion between enveloping members at reduced pressure by a hot plate, and heating and fusing the mutually facing heat seal layers along the core member shape.

21. (Withdrawn) A manufacturing method of vacuum heat insulator comprising the steps of disposing a flat core member between mutually facing heat seal layers of gas barrier enveloping member having heat seal layers, heating and pressing all parts including the core member present portion between enveloping members at reduced pressure by a hot plate, and heating and fusing the mutually facing heat seal layers along the core member shape.

22. (Withdrawn) The manufacturing method of vacuum heat insulator of claim 20 or 21, wherein a hot plate made of an elastic material is used.

23. (Withdrawn) A body warmer having a vacuum heating insulator of claim 3 disposed in clothes.

24. (Withdrawn) The body warmer of claim 23, wherein the vacuum heat insulator is inserted in a bag formed in the clothes.

25. (Withdrawn) The body warmer of claim 23, wherein the vacuum heat insulator is detachably fitted to clothes.

26. (Withdrawn-Currently Amended) A personal computer comprising a keyboard on the top of a main body, a printed board inside of the main body, a CPU on the printed board, a cooling device for releasing heat from the CPU, and a vacuum heat insulator according to claim 19 in a shape depending on the position of installation inside of the main body, wherein said vacuum heat insulator ~~is any one of claims 2 to 19, and~~ is installed at least in one of the inner side of the main body bottom positioned immediately beneath the CPU, and the back side of the keyboard positioned immediately above the CPU.

27. (Currently Amended) A vacuum heat insulator comprising first and second gas barrier enveloping members, and a flat core member,

wherein each of said first and second gas barrier enveloping members comprise heat seal layers,

wherein said core member is evacuated and sealed between the first and second enveloping members utilizing said heat seal layers,

wherein the first and second enveloping members are heated and pressed to seal the entire core member between said first and second enveloping members,

wherein said first and second enveloping members are heated and fused together utilizing said heat seal layers at portions where said core member is not disposed between said first and second enveloping members,

wherein a border region seal is formed by portions of said first and second enveloping members where said core member is disposed between the two enveloping members and portions where the core member is not disposed between first and second enveloping members, and

wherein said border region seal has a shape that corresponds to the periphery of the core member, and

wherein the entire portion of the first and second enveloping members adhering to each other is heated and fused.
